Step 1 – Open adobe Photoshop and at the top click on the window link which will bring a drop down menu and you must select actions to bring up the plugins Photoshop action scripts.

Step 2 – When you buy bookcoveromatic.com book cover package it comes with Photoshop plugins inside a folder called ecover action scripts and looks like this below.

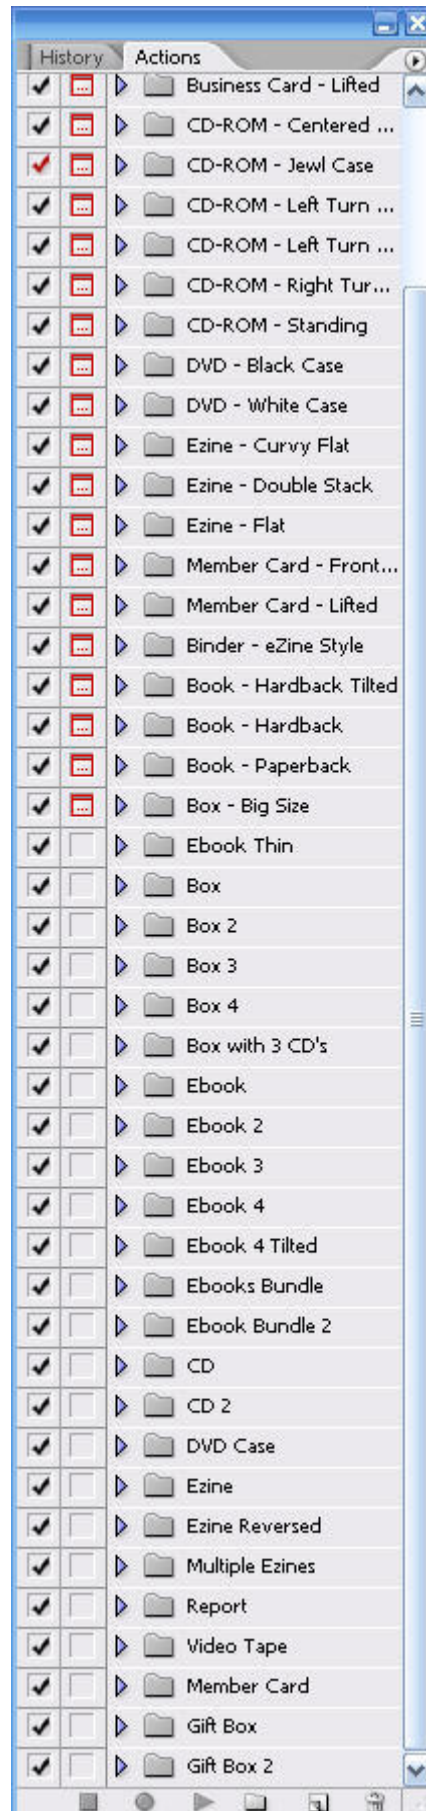

Step 3 – There are 2 ways to install the Photoshop plugins

1. Hold your mouse and drag it over all the action scripts above until they are highlighted.

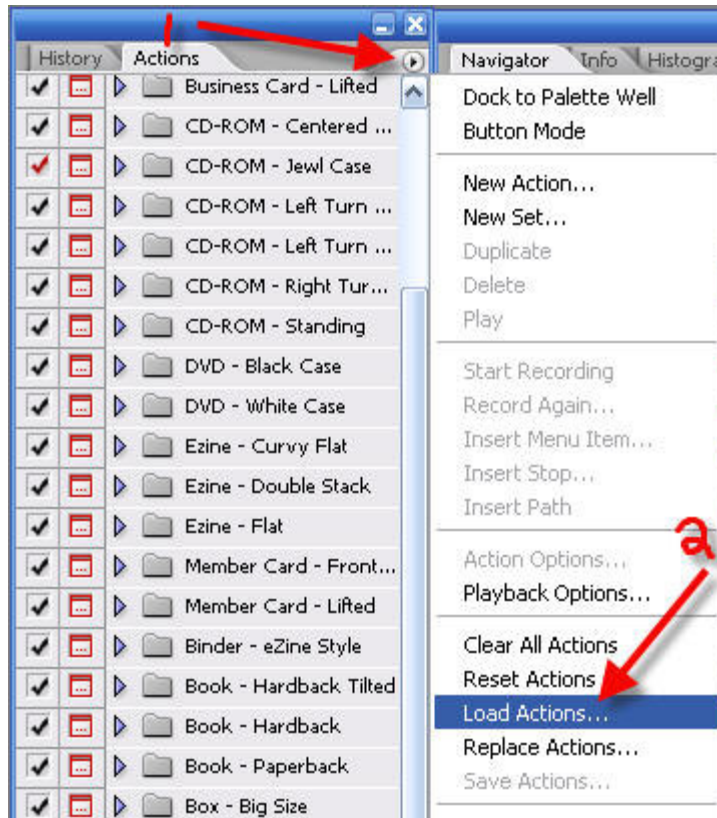

2. Then you move the entire list of highlighted plugins Photoshop then drag the entire list above into the actions script area of adobe Photoshop and let them go. See the photo below.

3. The second way of adding adobe Photoshop plugins is by clicking on the small triangle inside the actions at the top and load each individual action script or plugins Photoshop, one by one.

When you click on the Photoshop plugins load actions it brings up a folder and you need to find the folder called ecover action scripts and install each action script separately which takes time. I prefer to drag the entire set from above and drop them into the actions area below.

Once you have your action scripts or plugins Photoshop installed you will be able to start creating some spectacular 3D ebook covers, book covers, software boxes and lots more.

You will need to add your own Photoshop graphics into the action scripts and I will show you how to create each cover inside the Photoshop plugins you see in the above photos. Just read the next series of articles in this adobe tutorial.
